

CRAFTING IDEA

GB

At home in a cosy atmosphere.
With your beeswax candle.

Used items:

31 009 00	Round wick no. 7	20 cm
31 045 00	Beeswax pellets	180 g
89 389 00	Wax melting pot 1l	1 piece

Additionally you need:

31 171 00	Candle casting mould, cylindrical, flat, 5 cm ø	1 piece
	Kitchen scales	
	Saucepan	
	Thermometer	

Instructions:

- 1** For beeswax candles, use the round wick (item no. 31 009 00). Fix the wick in a suitable candle casting mould according to the instructions.
- 2** Pour water into the saucepan and heat it up.
- 3** Fill the the wax melting pot with the wax pellets weighed out and put it in the hot water bath to melt.
- 4** Take the wax melting pot out of the hot water bath. Pour the molten wax carefully and evenly into the already prepared casting mould (to about 3 mm below the edge) and then leave it to cool down (for about one day).
- 5** When the wax cools down, a small dimple often appears in the middle of the candle, which can be filled up by refilling (step 1-3).
- 6** Loosen the knot from the wick and carefully pull the cooled candle out of the casting mould by the wick. If the candle cannot be easily demoulded, place the candle casting mould in the freezer for a short time.

TIPS:

- The melting temperature of wax pellets is about 60° C.
- Never place the wax melting pot with the wax pellets directly on an open fire or a hot hob. This may cause a fire hazard!
- Do not expose melted wax to temperatures above 60° C for a long time.
